

1    **ABSTRACT**

2           Methods and systems enable uncompressed source data, corresponding to  
3   previously-compressed data, to be manipulated or otherwise modified, prior to  
4   being rendered by a rendering application. For example, audio data can be  
5   modified to include additional audio content, and/or video data can be modified to  
6   include additional video content. Accordingly, when the modified or manipulated  
7   source data is rendered by the rendering application, it can contain additional  
8   information that was not part of the previously-compressed data.
